Clam semantics

Maxime Mulder

Introduction

This document is the work-in-progress specification of the Clam programming language semantics. It is mostly based on the semantics of System $F^{\omega}_{<:}$ and captures most of the behaviours of Clam. However, it is not yet complete and lacks proofs. It could also benefit from more elegant evaluation semantics.

This document has been written using <u>Typst</u>.

Grammar

The abstract syntax of Clam is given by the following grammar:

Kinding

The syntax of kinds is given by the following grammar:

Kind
$$k = *$$
 type $| k \rightarrow k$ arrow

The kinding judgement is of the form $\Delta \vdash \tau :: k$. The hypotheses of Δ are of the form $t <: \tau$.

Type equivalence

The type equivalence judgement is of the form $\Delta \vdash \tau \equiv \tau'$. The following rules describe the reflexivity, symmetry and transitivity properties of the type equivalence relation.

$$\frac{}{\tau \equiv \tau} \text{E-Refl} \qquad \frac{\Delta \vdash \tau_1 \equiv \tau_2}{\Delta \vdash \tau_2 \equiv \tau_1} \text{E-Symm} \qquad \frac{\Delta \vdash \tau_1 \equiv \tau_2}{\Delta \vdash \tau_1 \equiv \tau_3} \text{E-Trans}$$

The following rules describe type equivalence for data types.

$$\frac{\Delta \vdash \tau_1 \equiv \tau_1' \quad \dots \quad \Delta \vdash \tau_n \equiv \tau_n'}{\Delta \vdash \langle \tau_1, \dots, \tau_n \rangle} \to \langle \tau_1', \dots, \tau_n' \rangle} \to \text{Tuple}$$

$$\frac{\Delta \vdash \tau_1 \equiv \tau_1' \quad \dots \quad \Delta \vdash \tau_n \equiv \tau_n'}{\Delta \vdash \langle l_1 : \tau_1, \dots, l_n : \tau_n \rangle} \to \langle l_1 : \tau_1', \dots, l_n : \tau_n' \rangle} \to \text{E-Record}$$

$$\frac{\Delta \vdash \tau_1 \equiv \tau_1' \quad \Delta \vdash \tau_2 \equiv \tau_2'}{\Delta \vdash \tau_1 \to \tau_2 \equiv \tau_1' \to \tau_2'} \to \text{E-Abs} \qquad \frac{\Delta \vdash \tau_1 \equiv \tau_1' \quad \Delta \vdash \tau_2 \equiv \tau_2'}{\Delta \vdash \forall t <: \tau_1. \ \tau_2 \equiv \forall t <: \tau_1'. \ \tau_2'} \to \text{E-Univ}$$

$$\frac{\Delta \vdash \tau_1 \equiv \tau_1' \quad \Delta \vdash \tau_2 \equiv \tau_2'}{\Delta \vdash \Lambda T <: \tau_1. \ \tau_2 \equiv \Lambda t <: \tau_1'. \ \tau_2'} \to \text{E-TAbs}$$

$$\frac{\Delta \vdash \tau_1 \equiv \tau_1' \quad \Delta \vdash \tau_2 \equiv \tau_2'}{\Delta \vdash \tau_1 [\tau_2] \equiv \tau_1' [\tau_2']} \to \text{E-TAPP}$$

$$\frac{(\Lambda t <: \tau_1. \ \tau_2)[\tau_3] \equiv [t/\tau_3]\tau_2} \to \text{E-TABSAPP}$$

The following rules describe the commutativity, associativity, distribution and inclusion properties of union and intersection types.

Note: What about the absorbtion law?

The following rules describe the distributivity of intersection types over data types.

Subtyping

The subtyping judgement is of the form $\Delta \vdash \tau <: \tau'$.

$$\frac{\Delta \vdash \tau_1 \equiv \tau_2}{\Delta \vdash \tau_1 <: \tau_2} \text{S-EQ} \qquad \frac{\Delta \vdash \tau_1 <: \tau_2}{\Delta \vdash \tau_1 <: \tau_3} \text{S-Trans} \qquad \frac{t <: \tau \in \Delta}{\Delta \vdash t <: \tau} \text{S-Var}$$

$$\frac{\Delta \vdash \tau_1 :: *}{\Delta \vdash \tau <: \tau} \text{S-Top} \qquad \frac{\Delta \vdash \tau_1 :: *}{\Delta \vdash \bot <: \tau} \text{S-Bot}$$

$$\frac{\Delta \vdash \tau_1 :: *}{\Delta \vdash \bot <: \tau} \text{S-Hot}$$

$$\frac{\Delta \vdash \tau_1 :: *}{\Delta \vdash \bot <: \tau} \text{S-Tuple}$$

$$\frac{\Delta \vdash \tau_1 <: \tau_1' \quad \dots \quad \Delta \vdash \tau_n <: \tau_n'}{\Delta \vdash (\tau_1, \dots, \tau_n) <: (\tau_1', \dots, \tau_n')} \text{S-Tuple}$$

$$\frac{\Delta \vdash \tau_1 <: \tau_1' \quad \dots \quad \Delta \vdash \tau_n <: \tau_n' \quad n \leqslant m}{\Delta \vdash (t_1 :: \tau_1, \dots, t_m :: \tau_m) <: (t_1 :: \tau_1', \dots, t_n :: \tau_n')} \text{S-Record}$$

$$\frac{\Delta \vdash \tau_1' <: \tau_1 \quad \Delta \vdash \tau_2 <: \tau_2'}{\Delta \vdash \tau_1 \to \tau_2 <: \tau_1' \to \tau_2'} \text{S-Abs} \qquad \frac{\Delta \vdash \tau_1 \equiv \tau_1' \quad \Delta, t <: \tau_1 \vdash \tau_2 <: \tau_2'}{\Delta \vdash \forall t <: \tau_1, \tau_2 <: \forall t <: \tau_1', \tau_2'} \text{S-Univ}$$

$$\frac{\Delta \vdash \tau_1' \equiv \tau_1 \quad \Delta \vdash \tau_2 <: \tau_2'}{\Delta \vdash \Delta \vdash \tau_1 :: \tau_1} \text{S-TAbs} \qquad \frac{\Delta \vdash \tau_1' <: \tau_1 \quad \Delta \vdash \tau_2 \equiv \tau_2'}{\Delta \vdash \tau_1 :: \tau_2} \text{S-TApp}$$

$$\frac{\Delta \vdash \tau_1 <: \tau_1}{\Delta \vdash \tau_1 :: \tau_1} \frac{\Delta \vdash \tau_2 <: \tau_1'}{\Delta \vdash \tau_1 :: \tau_1} \text{S-Union1} \qquad \frac{\Delta \vdash \tau_1 <: \tau}{\Delta \vdash \tau_1 :: \tau_1} \frac{\Delta \vdash \tau_1 <: \tau}{\Delta \vdash \tau_1 :: \tau_2} \text{S-Inter2}$$

$$\frac{\Delta \vdash \tau_1 <: \tau}{\Delta \vdash \tau_1 :: \tau_1} \frac{\Delta \vdash \tau_2 <: \tau}{\Delta \vdash \tau_2 <: \tau_1} \text{S-Union1} \qquad \frac{\Delta \vdash \tau_1 <: \tau}{\Delta \vdash \tau_1 :: \tau_1} \frac{\Delta \vdash \tau_1 <: \tau_2}{\Delta \vdash \tau_1 :: \tau_1} \text{S-Inter2}$$

Typing

The typing judgement is of the form $\Delta \Gamma \vdash e : \tau$. The hypotheses of Γ are of the form $x : \tau$.

$$\frac{x:\tau\in\Gamma}{\Gamma\vdash x:\tau}\text{T-VAR}\qquad\frac{\Delta\;\Gamma\vdash e:\tau\quad\Delta\vdash\tau<\tau'}{\Delta\;\Gamma\vdash e:\tau'}\text{T-Sub}$$

$$\frac{1}{\alpha\;\Gamma\vdash u:\tau}\text{T-Int}\qquad\frac{1}{\alpha\;\Gamma\vdash u:\tau}\text{T-Sub}$$

$$\frac{\Delta\;\Gamma\vdash e_1:\tau_1}{\Delta\;\Gamma\vdash e_1:\tau_1}\qquad \Delta\;\Gamma\vdash e_n:\tau_n}{\Delta\;\Gamma\vdash e_1:\tau_1}\text{T-Tuple}\qquad\frac{\Delta\;\Gamma\vdash e:\langle\tau_1,...,\tau_n\rangle}{\Delta\;\Gamma\vdash e.i:\tau_i}\text{T-TupleProj}$$

$$\frac{\Delta\;\Gamma\vdash e_1:\tau_1}{\Delta\;\Gamma\vdash \langle e_1,...,e_n\rangle:\langle\tau_1,...,\tau_n\rangle}\text{T-Tuple}\qquad\frac{\Delta\;\Gamma\vdash e_n:\tau_n}{\Delta\;\Gamma\vdash e.i:\tau_i}\text{T-Record}$$

$$\frac{\Delta\;\Gamma\vdash e_1:\tau_1}{\Delta\;\Gamma\vdash\langle l_1=e_1,...,l_n=e_n\rangle:\langle l_1:\tau_1,...,l_n:\tau_n\rangle}\text{T-RecordProj}$$

$$\frac{\Delta\;\Gamma\vdash e:\langle l_1:\tau_1,...,l_n:\tau_n\rangle}{\Delta\;\Gamma\vdash e.l_i:\tau_i}\text{T-Abs}$$

$$\frac{\Delta\;\Gamma\vdash e:\langle l_1:\tau_1,...,l_n:\tau_n\rangle}{\Delta\;\Gamma\vdash e.l_i:\tau_i}\text{T-Cuniv}$$

$$\frac{\Delta\vdash\tau_1::*\quad\Delta\;\Gamma,x:\tau_1\vdash e:\tau_2}{\Delta\;\Gamma\vdash\lambda x:\tau_1.\;e:\forall t<:\tau_1.\;\tau_2}\text{T-Univ}$$

$$\frac{\Delta,t<:\tau_1\;\Gamma\vdash e:\tau_2}{\Delta\;\Gamma\vdash\lambda t<:\tau_1.\;e:\forall t<:\tau_1.\;\tau_2}\text{T-Univ}$$

$$\frac{\Delta\;\Gamma\vdash e:\forall t<:\tau_1.\;\tau_2}{\Delta\;\Gamma\vdash e[\tau_3]:[t/\tau_3]\tau_2}\text{T-UnivApp}$$

$$\frac{\Delta\vdash\tau::*\quad\Delta\;\Gamma\vdash e:\tau}{\Delta\;\Gamma\vdash e:\tau:\tau}\text{T-Ascr}$$

Primitives

The types of the primitive values of Clam are given by the following table:

Symbol	Туре
+ (unary)	Int $ ightarrow$ Int
- (unary)	Int $ ightarrow$ Int
!	Bool $ ightarrow$ Bool
+ (binary)	$Int \to Int \to Int$
- (binary)	$Int \to Int \to Int$
*	Int $ ightarrow$ Int $ ightarrow$ Int
/	Int $ ightarrow$ Int $ ightarrow$ Int
%	Int $ ightarrow$ Int $ ightarrow$ Int
++	String o String o String
==	op op op Bool
!=	op op op Bool
<	Int o Int o Bool
>	Int $ ightarrow$ Int $ ightarrow$ Bool
<=	$Int \to Int \to Bool$
>=	$Int \to Int \to Bool$
	${\tt Bool} \to {\tt Bool} \to {\tt Bool}$
&	${\tt Bool} \to {\tt Bool} \to {\tt Bool}$
if	$\forall T_1. \ \forall T_2. \ \operatorname{Bool} \to T_1 \to T_2 \to T_1 \cup T_2$

Note: if is not implemented as a primitive value yet.

Evaluation

The syntax of values is given by the following grammar:

$$\begin{array}{lll} \text{Value } v \coloneqq u & \text{unit} \\ & | \ b & \text{boolean} \\ & | \ i & \text{integer} \\ & | \ s & \text{string} \\ & | \ \langle v_1, ..., v_n \rangle & \text{tuple} \\ & | \ \langle l_1 = v_1, ..., l_n = v_n \rangle & \text{record} \\ & | \ \lambda x. \ e & \text{abstraction} \\ & | \ \lambda t. \ e & \text{universal abstraction} \end{array}$$

The evaluation judgement is of the form $e \downarrow v$.

$$\frac{e_1 \Downarrow v_1 \quad \dots \quad e_n \Downarrow v_n}{\langle e_1, \dots e_n \rangle \Downarrow \langle v_1, \dots, v_n \rangle} \text{V-Tuple} \qquad \frac{e \Downarrow \langle v_1, \dots, v_n \rangle}{e.i \Downarrow v_i} \text{V-TupleProj}$$

$$\frac{e_1 \Downarrow v_1 \quad \dots \quad e_n \Downarrow v_n}{\langle l_1 = e_1, \dots, l_n = e_n \rangle \Downarrow \langle l_1 = v_1, \dots, l_n = v_n \rangle} \text{V-Record}$$

$$\frac{e \Downarrow \langle l_1 = v_1, \dots, l_n = v_n \rangle}{e.l_i \Downarrow v_i} \text{V-RecordProj}$$

$$\frac{e \Downarrow \langle l_1 = v_1, \dots, l_n = v_n \rangle}{e.l_i \Downarrow v_i} \text{V-Abs} \qquad \frac{e_1 \Downarrow \lambda x. \ e_3 \quad [e_2/x]e_3 \Downarrow v}{e_1(e_2) \Downarrow v} \text{V-AbsApp}$$

$$\frac{\lambda x : \tau. \ e \Downarrow \lambda x. \ e}{\lambda t <: \tau. \ e \Downarrow \lambda t. \ e} \text{V-Univ} \qquad \frac{e_1 \Downarrow \lambda t. \ e_2}{e_1[\tau] \Downarrow e_2} \text{V-UnivApp}$$

$$\frac{e \Downarrow v}{e : \tau \Downarrow v} \text{V-Ascr}$$
